Our independent analysis of floors and walkways is done by a mechanical engineer who has been trained and certified in the use of the Bot-3000 by the National Floor Safety Institute. The slip tester provides accurate measurements of dry and wet, static and kinetic coefficients of friction, commonly called slip resistance.

These measurements provide a reliable way to document due diligence and the effectiveness of remediation. We can determine the effectiveness of cleaning chemicals, cleaning procedures, and floor or walkway finishes in reducing potential slips and falls, by conducting baseline and post-remediation tests.
